

NODAL Measurements for PRO35

If your PRO35 Image Converter is used with a motion control rig the following offsets should be considered if move data is about to be used on a 3 D system. Try to match the center of rotation on the motion control as close as possible to the actual nodal point of the lens by using these offsets or use these offsets later in your 3D environment.

Please note: Nodal parameters vary on 35mm lenses. Please contact your rental house or your local camera supplier for information of the distance from lens nodal to film plane (image plane of Pro 35).
